

dark frame x output $y = f(x)$ reference g residual $a y - g$ 

decompose

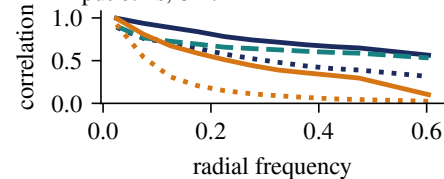

low-freq.
block gain
high-freq.

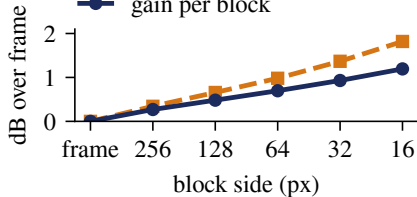

band diagnostics

— model 0.1 s
- - input 0.1 s
- - input 0.1 s, 8 fr.
— model 0.033 s
- - input 0.033 s

— affine per block
— gain per block

$a = \langle y, g \rangle / \langle y, y \rangle$, the best single gain
